The Problem, The Solution

01.

Difficulty understanding personal flavor preferences in whisky
- Recommendations based on user-reported food preferences

The Problem

- 4 whisky flavours quadrants
- 6 whisky production regions
- 146 whisky distillery

The Hypothesis

- Sweet preferences: Recommend smoother whiskies with hints of vanilla, caramel, or honey (e.g., Speyside single malts, some bourbons)
- Savory preferences: Recommend whiskies with nutty, salty, or herbal notes (e.g., Irish whiskies, some Highland single malts)
- Spicy preferences: Recommend whiskies with peppery or smoky notes (e.g., Islay single malts, some rye whiskies)

Proposed Methods & Techniques

02.

How data is retrived
 Recommender system

Data Collection

- Using of API, PRAW, to scrape
 Reddit r/Whisky, r/Scotch
- Collect reviews done by Redditor
 u/buckydean, u/adunitbx
- Using of Pandas package to perform data cleaning

Machine Learning Techniques

- Using of Python package Scikit Learn
- Uses words to determine the connection between food preference and whisky
- Using of LLM to prompt questions to get user preferences and provide recommendation

Marketing 2XXX

USP & Success

03.

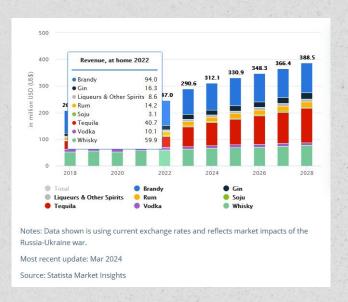

- Why is my project Unique

- How to define sucess

Target Audience

Success Metrics

- Accuracy: How well it understands user input regarding food preferences
- Generalizability: Ability to handle variations in languages such as slangs and sarcasm
- LLM: comparison of RAGAS between different engines
